

FixZ-7

The optimum additional elevation for flatly inclined trapezoidal sheet metal roofs

- Quick and easy mounting
- Better rear airing
- Better self-cleaning
- Optimum load transmission into the roof cladding

Description

In case of flat trapezoidal sheet metal roofs with inclinations of less than 10 degrees, a mounting parallel to the roof is not the best solution, because of the low yields and the insufficient self-cleaning of the modules. But in many cases, a normal elevation with supporting stands is not economic or structurally not possible due to the heavier loads. Quite often, only low elevation angles are desired respectively feasible.

Schletter **FixZ-7** offers a simple and inexpensive additional elevation for these problem cases.

Application information

Please consider that the system is designed for module heights from about 1.3 m up to 1.7 m and setting angles from **5 – 7 degrees**

For technical reasons, **FixZ-7** is only suitable for vertical mounting of framed modules. However, a horizontal mounting with linear support and linear clamping is also possible up to a module width of 850 mm.

The position of the clamping spots should be within the range of 1/4-1/5 of the module height (respectively according to manufacturer information).

Moreover, there must be minimum distances of 1.5 m to the lateral roof edges, and distances of 1.2 m to both the north and the south roof edge.

1 Mounting of the Fix2000ClickTop connector.

Consider the shade distance to the module rows!

2 Mounting of the Fix-Z 7 cross beam profiles.

Fix the profile joint with a connector plate and self-drilling screws

3 Mounting of the modules
