

## Form C: Type Test Verification Report

Type Approval and **Manufacturer** declaration of compliance with the requirements of G98.

This form should be used when making a Type Test submission to the Energy Networks Association (ENA).

If the **Micro-generator** is **FullyType Tested** and already registered with the ENA **Type Test Verification Report** Register, the **Installation Document** should include the **Manufacturer**'s Reference Number (the Product ID), and this form does not need to be submitted.

Where the **Micro-generator** is not registered with the ENA **Type Test Verification Report** Register this form needs to be completed and provided to the **DNO**, to confirm that the **Micro-generator** has been tested to satisfy the requirements of this EREC G98.

Note that to house.	esting can b	e done by the	e Manufactu	<b>urer</b> of an indivi	dual component or by an external test		

Where parts of the testing are carried out by persons or organisations other than the **Manufacturer** then that person or organisation shall keep copies of all test records and results supplied to them to verify that the testing has been carried out by people with sufficient technical competency to carry out the tests.

Operating Range: This test should be carried out as specified in EN 50438 D.3.1.

Active Power shall be recorded every second. The tests will verify that the **Micro-generator** can operate within the required ranges for the specified period of time.

The Interface Protection shall be disabled during the tests.

In case of a PV Micro-generator the PV primary source may be replaced by a DC source.

In case of a full converter **Micro-generator**(eg wind) the primary source and the prime mover **Inverter**/rectifier may be replaced by a **DC** source.

In case of a DFIG **Micro-generator**the mechanical drive system may be replaced by a test bench motor.

Test 1 Voltage = 85% of nominal (195.5 V) Frequency = 47.5 Hz Power factor = 1 Period of test 90 minutes	Tested with the specified conditions,in the 90 minutes period of time,the inverters operate normally
Test 2 Voltage = 110% of nominal (253 V). Frequency = 51.5 Hz Power factor = 1 Period of test 90 minutes	Tested with the specified conditions,in the 90 minutes period of time,the inverters operate normally
Test 3 Voltage = 110% of nominal (253 V). Frequency = 52.0 Hz Power factor = 1 Period of test 15 minutes	Tested with the specified conditions,in the 15 minutes period of time,the inverters operate normally

Power Quality – Harmonics: These tests should be carried out as specified in BS EN 61000-3-2. The chosen test should be undertaken with a fixed source of energy at two power levels a) between 45 and 55% and b) at 100% of Registered Capacity. The test requirements are specified in Annex A1A.1.3.1 (Inverter connected) or Annex A2 A.2.3.1 (Synchronous).

Note the higher limits for odd harmonics 21 and above are only allowable under certain conditions, if these higher limits are utilised please state the exemption used as detailed in part 6.2.3.4 of BS EN 61000-3-2 in the box below.

**Power Quality – Voltage fluctuations and Flicker**: These tests should be undertaken in accordance with EREC G98 Annex A1 A.1.3.3 (**Inverter** connected) or Annex A2 A.2.3.3 (Synchronous).

	Starting			Stopping	g		Running	
	d max	dc	d(t)	d max	dc	d(t)	P <sub>st</sub>	P <sub>lt</sub> 2 hours
Measured Values at test	0.52	0.36	0	0.36	0	0	0.051	0.070

impedance											
Normalised to standard impedance	N/A	N/A	N/A	<b>\</b>	N/A	N/A	N/A	١	٦	N/A	N/A
Normalised to required maximum impedance	N/A	N/A	N/A	<b>\</b>	N/A	N/A	N/A	λ	1	N/A	N/A
Limits set under BS EN 61000- 3-11	4%	3.3%	3.3%	6	4%	3.3%	3.3%	6		1.0	0.65
Test Impedance	R			Ω		х				Ω	
Standard Impedance	R	0.24 * 0.4 ^		Ω		х			15 * 25 ^	Ω	
Maximum Impedance	R			Ω		х				Ω	

Applies to three phase and split single phase **Micro-generators**.

^ Applies to single phase **Micro-generators** and **Micro-generators** using two phases on a three phase system.

For voltage change and flicker measurements the following formula is to be used to convert the measured values to the normalised values where the power factor of the generation output is 0.98 or above.

Normalised value = Measured value\*reference source resistance/measured source resistance at test point. Single phase units reference source resistance is  $0.4 \Omega$ 

Two phase units in a three phase system reference source resistance is  $0.4 \Omega$ .

Two phase units in a split phase system reference source resistance is 0.24  $\Omega$ .

Three phase units reference source resistance is 0.24  $\Omega$ .

Where the power factor of the output is under 0.98 then the X to R ratio of the test impedance should be close to that of the Standard Impedance.

The stopping test should be a trip from full load operation.

The duration of these tests need to conform to the particular requirements set out in the testing notes for the technology under test. Dates and location of the test need to be noted below.

Test start date	1.December.2018	Test end date	7.December.2018
Test location	Ningbo Ginlong electri	cal R&D LAB

	he notes in									EN 50438 Annex anex A2 A.2.2.3	
Function	S	etting		Trip	tes	st	"No trip			tests"	
	Frequency	Time c	lelay	Frequency	Т	ime delay	y F	requency	/time	Confirm no trip	
U/F stage 1	47.5 Hz	20	s	47.46Hz		20.035s		47.7 H 25.1s		Yes	
U/F stage 2	47 Hz	0.5	S	46.96Hz		0.542s		47.2 H 19.98		Yes	
								46.8 H 0.48 s		Yes	
O/F stage 1	52 Hz	0.5	s	52.04Hz		0.531s		51.8 H 89.98		Yes	
								52.2 H 0.48 s		Yes	

Note. For frequency trip tests the frequency required to trip is the setting  $\pm 0.1$  Hz. In order to measure the time delay a larger deviation than the minimum required to operate the projection can be used. The "No trip tests" need to be carried out at the setting  $\pm 0.2$  Hz and for the relevant times as shown in the table above to ensure that the protection will not

trip in error.

## **Protection – Voltage tests:** These tests should be carried out in accordance with EN 50438 Annex D.2.3 and the notes in EREC G98 Annex A1 A.1.2.2 (**Inverter** connected) or Annex A2 A.2.2.2 (Synchronous)

Function	Set	tting	Trip	test	"No trip tests"		
	Voltage	Time delay	Voltage	Time delay	Voltage /time	Confirm no trip	
U/V	184 V	2.5 s	183.5 V	2.543s	186 V 3.50 s	Yes	
					182 V 2.48 s	Yes	
O/V stage 1	262.2 V	1.0 s	262.5 V	1.046 s	260.2 V 2.0 s	Yes	
O/V stage 2	273.7 V	0.5 s	274.0 V	0.544 s	269.7 V 0.98 s	Yes	
					277.7 V 0.48 s	Yes	

Note for Voltage tests the Voltage required to trip is the setting  $\pm 3.45$  V. The time delay can be measured at a larger deviation than the minimum required to operate the protection. The No trip tests need to be carried out at the setting  $\pm 4$  V and for the relevant times as shown in the table above to ensure that the protection will not trip in error.

Protection – Loss of Mains test: For PV Inverters shall be tested in accordance with BS EN 62116. Other Inverters should be tested in accordance with EN 50438 Annex D.2.5 at 10%, 55% and 100% of rated power.

To be carried out at three output power levels with a tolerance of plus or minus 5% in Test Power levels.

Test Power	10%	55%	100%	10%	55%	100%
Balancing load on islanded network	95% of Registered Capacity	95% of Registered Capacity	95% of Registered Capacity	105% of Registered Capacity	105% of Registered Capacity	105% of Registered Capacity
Trip time. Limit is 0.5 s	0.31s	0.34s	0.43s	0.33s	0.29s	0.36s

For Multi phase **Micro-generators** confirm that the device shuts down correctly after the removal of a single fuse as well as operation of all phases.

<b>Limited Frequency Sensitive Mode – Overfrequency test:</b> This test should be carried out in accordance with EN 50438 Annex D.3.3 Power response to over- frequency. The test should be carried out using the specific threshold frequency of 50.4 Hz and <b>Droop</b> of 10%.									
Test sequence at <b>Registered</b> <b>Capacity</b> >80%	Measured Active PowerOutput	Frequency		Primary Power Source		Active Power Gradient			
Step a) 50.00 Hz ±0.01 Hz	2000.61	50.01				100.00%			
Step b) 50.45 Hz ±0.05 Hz	1980.51	50.46				99.00%			
Step c) 50.70 Hz ±0.10 Hz	1880.49	50.71				94.00%			
Step d) 51.15 Hz ±0.05 Hz	1700.44	51.16				85.00%			
Step e) 50.70 Hz ±0.10 Hz	1880.49	50.71				94.00%			
Step f) 50.45 Hz ±0.05 Hz	1980.51	50.46				99.00%			
Step g) 50.00 Hz ±0.01 Hz	2000.85	50.0	01			100.00%			
Test sequence at <b>Registered Capacity</b> 40% - 60%	Measured Active PowerOutput	Frequency		Primary Power Source		Active Power Gradient			
Step a) 50.00 Hz ±0.01 Hz	1000.68	50.01				50.00%			
Step b) 50.45 Hz ±0.05 Hz	990.52	50.46				49.50%			
Step c) 50.70 Hz ±0.10 Hz	940.50	50.71				47.00%			
Step d) 51.15 Hz ±0.05 Hz	850.45	51.16				42.50%			
Step e) 50.70 Hz ±0.10 Hz	940.50	50.71				47.00%			
Step f) 50.45 Hz ±0.05 Hz	990.52	50.46				49.50%			
Step g) 50.00 Hz ±0.01 Hz	1000.54	50.01				50.00%			
Steps as defined in EN 5043	8								
<b>Power output with falling</b> Annex D.3.2 active power fe			should	be carried out	in accordanc	e with EN 50438			
Test sequence	Measured <b>Power</b> Outpu			Jency	Primary power source				
Test a) 50 Hz ± 0.01 Hz									
Test b) Point between 49.5 and 49.6 Hz	Hz								

Test c) Poi and 47.6 H	nt between 47. z	5 Hz									
NOTE: The operating point in Test (b) and (c) shall be maintained for at least 5 minutes											
Re-connection timer.											
Test should prove that the reconnection sequence starts after a minimum delay of 20 s for restoration of voltage and frequency to within the stage 1 settings of Table 2.											
Time delay setting	Measured delay			Checks on no reconnection when voltage or frequency outside stage 1 limits of table 2.					is brought to just		
30s	32s		At 266.2	2 V	At 196	At 196.1 V		At 47.4 Hz		At 52.1 Hz	
	Confirmation that the Micro- generator does not re-connect.		Yes			Yes		Yes		Yes	
<b>Fault level contribution</b> : These tests shall be carried out in accordance with EREC G98 Annex A1 A.1.3.5 (Inverter connected) and Annex A2 A.2.3.4 (Synchronous).											
For machin	For machines with electro-magnetic output For <b>Inverter</b> output										
Parameter	r Symbol Value		lue	Time after fault		r Volts		Amps			
Peak Short Circuit current		i <sub>ρ</sub>			20 ms		3.23V		13.05Apeak		
Initial Value of aperiodic current		A			100 ms		0		0		
Initial symmetrical short-circuit current*		I <sub>k</sub>			250 ms		0		0		
Decaying (aperiodic) component of short circuit current*		i <sub>DC</sub>			500 ms		0		0		
Reactance/Resistance Ratio of source*		×/ <sub>R</sub>			Time to trip		<20ms		In seconds		
For rotating machines and linear piston machines the test should produce a 0 s – 2 s plot of the short circuit current as seen at the <b>Micro-generator</b> terminals.											
* Values for these parameters should be provided where the short circuit duration is sufficiently long to enable interpolation of the plot											
Logic Interface.										Yes	
<b>Self-Monitoring solid state switching:</b> No specified test requirements. Refer to EREC G98 Annex A1 A.1.3.6 ( <b>Inverter</b> connected).										C	Yes/or NA
It has been varified that in the event of the call state suitables device follow to the											

It has been verified that in the event of the solid state switching device failing to NA disconnect the **Micro-generator**, the voltage on the output side of the switching device is

reduced to a value below 50 V within 0.5 s.
