## 1. General information

### 1.1 Getting start

This manual is used as a checking and repairing guide for Axpert Max-3600. Before read this manual, it's better to have some electrical or electronic background knowledge. With this guide, you can fix the inverter by yourself firstly.

There are five main parts of this guide:

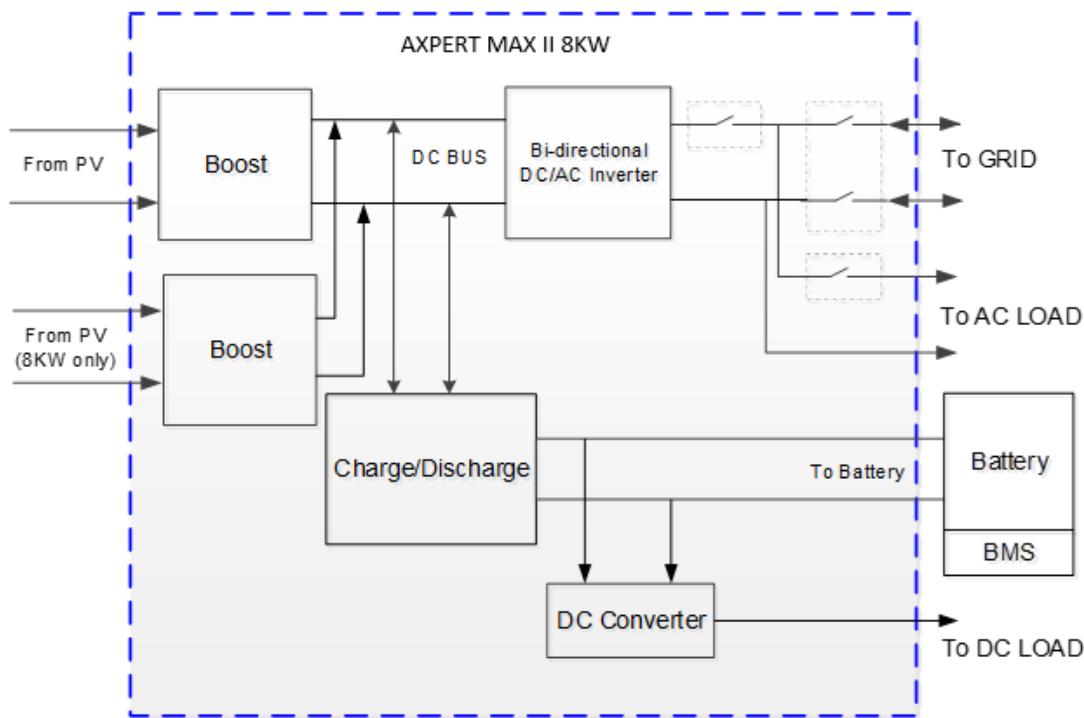

**General information:** This part is the basic information of the inverter; you can start to know the inverter from this chapter.

**Troubleshooting:** This part will tell you how to do when you face a problem.

**Checking and measuring guide:** This part will teach you how to check or repair the inverter by measuring the critical components.

**Assembling guide:** This part teaches you how to take the board outside and fix the new one.

**Cables connection guide:** This part will present the signal cables connection of the inverters.

### 1.2 Basic topology introduction

The topology of the inverter shows as below:

Compare with UPS or normal inverter, INVERTER combines a solar charger inside. Solar charger can be a supplement for battery when there is not grid. And with the solar charger, the inverter can have more working modes than UPS. For detail information please refer to our user manual

### 1.3 Inverter family

This service manual includes different models of the inverter, the table as below contains some important parameters with different models.

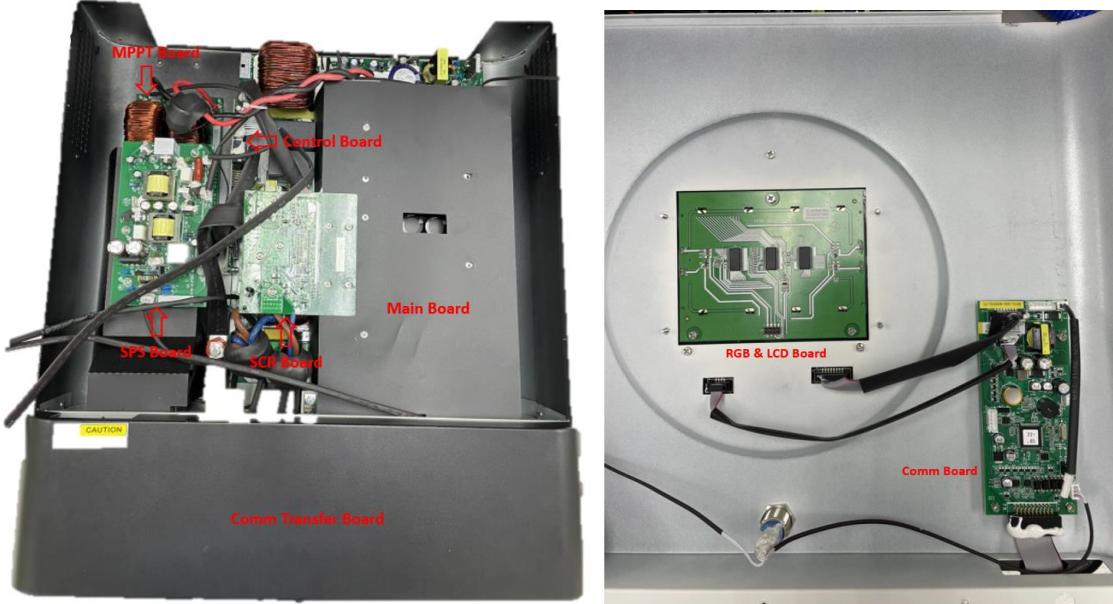

These models names are only neutral names; please match the real model name of your inverter to the

model name in the table by comparing the typical characteristics.

Model name	Power rating	Charger type	Charger number
AXPERT MAX II 8KW	8KVA	MPPT	1

## 2. Troubleshooting

### 2.1 How to do

When the inverter was faulty, normally there are two main symptoms:

- No display at all;
- Fault code or warning code on the LCD;

When the fault occurred, please help to record the fault information and follow "How to check" of part 2.2 to check the inverter, then feedback the checking result to the service center. It will be very helpful for solving the problem as soon as possible.

### 2.2 Fault condition

#### Note:

**When open the top cover, please have a look first, are there any obviously damaged parts?**

**When take the main board out, please have a look around, are there any obviously damaged parts?**

#### 2.2.1. Not working at all/ No display

Description	The inverter couldn't startup completely.
Possible reason	1. SPS module damaged.
How to check	1. Firstly, please measure the resistor between BAT+ and BAT-. If it is not shorted, only connect the inverter with battery, and press "ON" button, could the inverter startup? If not, please check the fan.

	2. If the LCD couldn't light up and fan doesn't work, please disconnect all the wires and open the top cover, and then take the main board outside by following part 4. 3. Check the main board by following "3.5 and 3.6"
How to solve	Repair the main or replace it directly.

### 2.2.2. 09 fault

Description	Bus soft start fails.
Possible reason	DC-DC module was damaged or BUS soft start module was damaged.
How to check	1. Check the main board by following "3.6; 3.7"; 2. Check the main board by following "3.1; 3.2; 3.3; 3.4".
How to solve	Repair the main board or replace it directly.

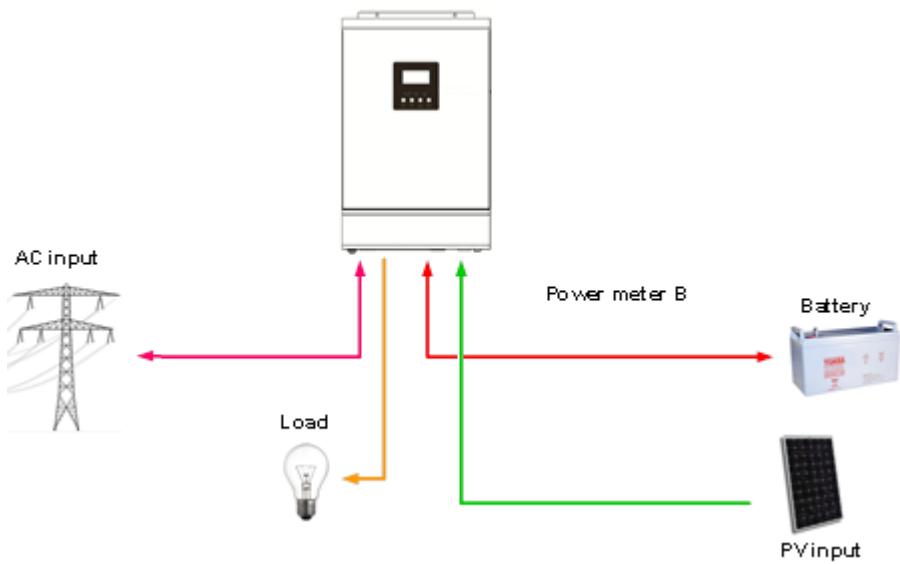

### 2.2.3. Warning

Description	Battery couldn't be detected.
Possible reason	Wire connection or fuse was burnt.
How to check	1. Check the wire connection, the priority of the battery cable; 2. Check the main board by following "3.1".
How to solve	Repair the main board or replace it directly.

## 2.3 Test step

After replacing all defected components, testing steps can be used to confirm the repair result and the reliability of the Inverter.

Set up the testing system as below:

### 3. Checking and measuring guide

3.1 Check the battery side components on MAIN board

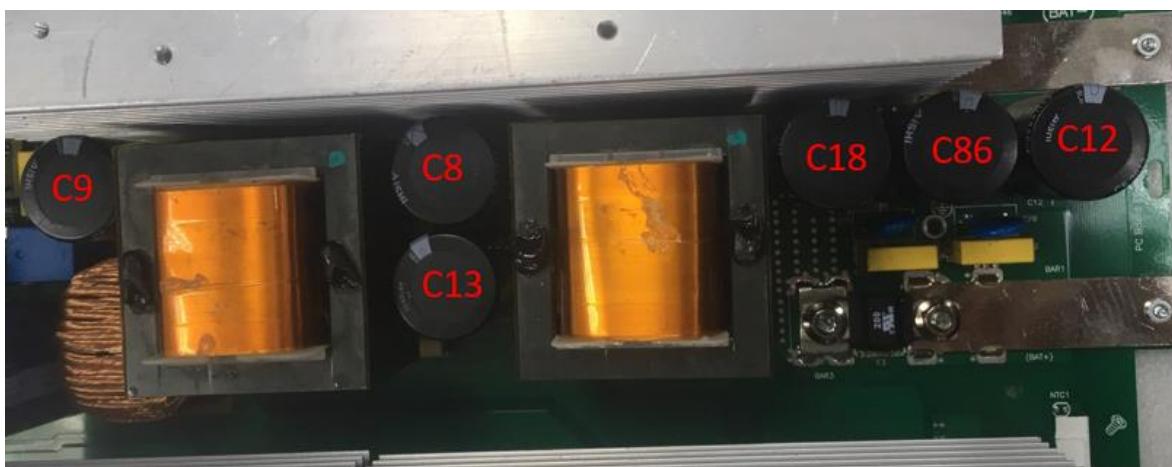

#### Fuse and capacitors

For AXPERT MAX II 8KW FUCE

Parts	Attribute	Reference values	Failure status
F3	Resistor	0.2 ohm	Open
GRID Input 63LET 63A 240VAC	Resistor	0.2 ohm	Open

For AXPERT MAX II 8KW C8/C9/C12/C13/C18/C86: (6800uF 63V)

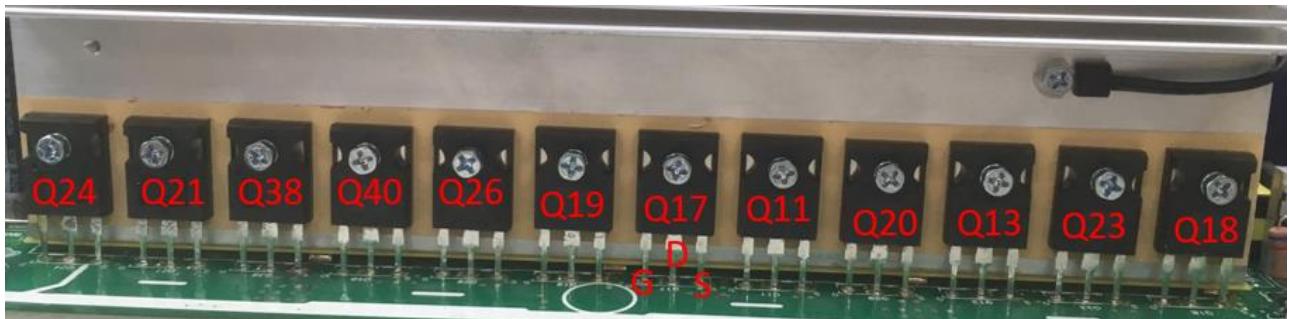

If the capacitors explode as below, they need to be replaced.

## Power devices

DC/DC MOSFET: Q24/Q21/Q38 & Q40/Q26/Q19 & Q17/Q11/Q20 & Q13/Q23/Q18

For AXPERT MAX II 8KW ALL of the MOSFET are (MOSFET IR/IRFP4668PBF 130A 200V N BULK TO-247)

	Diode	SD: 0.556V DS: OL	

**Note1:** When you use the multimeter to measure the resistor of the transistor, because of the capacitor in the circuit, it will cause the changing of the values when you measure the DS and GD. So we recommend you measure the diode forward voltage of SD, and the resistor of GS. These two values can reflect the situation of the transistor more correctly.

**Note2:** If one or more of them were damaged, please replace all of them.

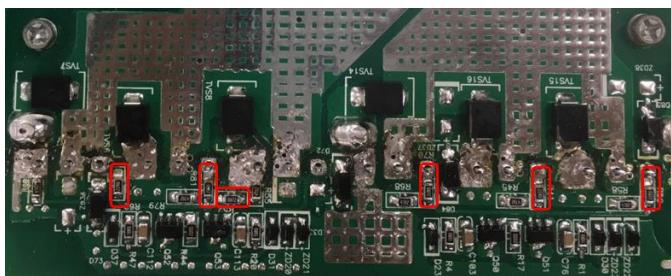

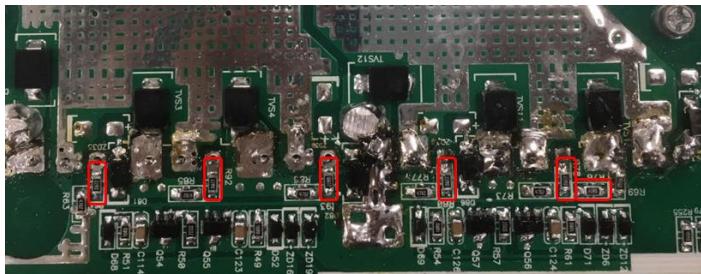

### 3.1.1. Drivers (This part is only used for repair checking)

**Note:** Drivers usually need to be checked when users want to repair the boards. Because when power devices were damaged, the high voltage will rush to driver circuit through the gates of power devices.

The reference of the resistors list as below:

R76/R78/R80/R93/R92/R64

R59/R41/R70/R52//R81/R62 All of the resistors are (22R 1206)

Use multimeter to measure each resistor, find the burnt resistors and replace them; don't need to replace them all.

Parts	Attribute	Reference values	Failure status
